An educational module on protecting water quality was developed for pesticide safety recertification classes. There are three modules, one for agricultural producers, one for homeowners, and one for professional landscaping applicators. I will present information about these modules, the benefits of using pesticide safety education programs to educate audiences on water quality protection, and share impact data that was collected from agricultural producers.

Future pesticide safety education programming is focused on environmental impacts such as ground and surface water protection, and will be available online and available to diverse group of citizens.
